

Experiment - 3

Student Name: Amol Saurav

Branch: BE-CSE

Semester: 6th

Subject Name: System Design

Subject Code: 23CSH-314

UID: 23BCS10067

Section/Group: KRG_2B

Date of Performance: 28/1/26

Aim:

To design a **Social Media Platform** that allows users to register, login, create posts, follow other users, and interact with posts through likes and comments, ensuring high availability, scalability, and low latency.

Objectives:

- i. To understand the working of a Social Media system
- ii. To identify **functional requirements** of the system
- iii. To identify **non-functional requirements** such as performance and scalability
- iv. To design a high-level system flow using **draw.io**
- v. To understand core entities involved in the platform

Procedure-

- i. Identify functional requirements of a social media platform.
- ii. Define non-functional requirements such as scalability, latency, and availability.
- iii. Analyze CAP theorem trade-offs for social media systems.
- iv. Identify core entities required for system implementation.
- v. Design the system architecture using Draw.io.
- vi. Validate the design against real-world social media behavior.

Functional Requirements -

- i. Users should be able to **register and login** to the application.
- ii. Users should be able to **create posts** (text / image / video).
- iii. Users should be able to **follow other users** or send friend requests.
- iv. Users should be able to **like and comment** on posts.
- v. Users should be able to **view a feed** consisting of posts from users they follow.

Non-functional Requirements

A. Scalability

- System should support up to 500 million daily active users (DAU).

B. Consistency and Availability

- The system prioritizes high availability over strong consistency.
- Temporary delays in post propagation are acceptable.

Justification:

If the application is unavailable during peak time, it leads to a major business loss.

Example:

If Instagram is down for 1 hour → **critical issue**

If a post reaches followers in 500 ms instead of instantly → **acceptable**

Hence,

Availability >>> Consistency

C. Latency

- Post upload and publish latency should be around **500 ms**.

Outcome / Result -

A complete high-level design of a social media platform was successfully created, identifying its functional requirements, non-functional constraints, core entities, and feed management strategy.

REQUIRED SYSTEM DESIGN –
